AuroraDecrypter Crack With Full Keygen Free X64

AuroraDecrypter was created by GeCKer, together with Wombat Security and PwC. Despite its simple setup, this is one powerful tool, especially designed to recover files that are affected by the most common types of ransomware. Aurora is one of the most successful ransomware, which was released in the summer of 2018. It collected over \$12,000 and its money-making strategy is questionable and not uncommon. Though, as far as the authors of the ransomware are concerned, they might come out of this one yet. Aurora works by hitting the victim's computer and locking their files by encrypting them with the ENCRYPTED.txt extension and then appending the AURORA extension. It is assumed it exploits vulnerable Remote Desktop Services. Even though it is not known exactly how the ransomware enters the victims' machines, security specialists say there are clues it may enter systems via the remote desktop services that are exposed. More precisely, it uses brute force to gain the password for the RDP and gain access to the computer. Once installed, Aurora connects to a specific Command and Control server in order to receive an encryption key and lock down various files on the computer. More information about the methods used by the authors of the ransomware are available on the Indicators section. On a side note, the ransomware also checks the location of the victim based on the IP address and apparently, it avoids encrypting data for PCs located in Russia. Apart from recovering files in the.DOC,.MP4,.FLV,.MP3 and.KMZ formats, you may also be able to recover documents that have been encrypted using the AES algorithm. To be precise, the AES algorithm works by encrypting the binary representation of the file using the constant key AES-256. The documents can be recovered using the DECRYPTOR tool. If you ever suspect that your computer has been infected by the ransomware, you can download AuroraDecrypter and run it. For starters, simply install it on your computer, then launch it, and it will try to decrypt your files using its secret key. When the encryption is completed successfully, you will see a red icon in your application list. You can select the file, hit the decrypt button, and the ransomware will finish the process. Though, this might take some time. Features: 1) Decrypt dozens of files within only a few minutes 2) Works with computers that have been infected
