When I cloned this repository, it is pulling down the files and folders from my local machine so I have to manually pull all the files from my server and manually move them to the correct directory on my server. The research was carried out in order to compare the proliferative activity and the regenerative potential of cells involved in cutaneous wound healing (i.e. epidermal and dermal cells) and tumoral cells. The cells were cultured in vitro in presence of EGF or FGF and the growth of cells was determined by their clonogenicity. The cells were also placed in vivo in immune depleted mice and the development of dermal tumors was studied. Finally, the experimental data obtained were compared with the results of
