One such tutorial is a series of six How-To Photoshop videos available from the user group of Lynda.com, a site that offers video tutorials on a range of topics, including those useful to the image manipulation or digital photography specialist. You can get the tutorial at `www.lynda.com/Photoshop-Tutorials`. Creating an HDR image Using the Multichannel settings in Photoshop, you can capture an entire image as a Single Channel HDR image. This enables you to combine and produce a single image from several images taken in different exposures for a photo shoot. You can then apply various adjustments to get the best possible print or monitor display from it. This chapter explains how to create a Single Channel HDR image, and it shows you a few of the adjustments you can make to it. But before you begin, follow these steps to ensure that you have the correct settings ready: 1. **Create a RAW file of a scene** 2. **Make sure that the file has been saved in Photoshop's native format as a RAW file** To capture the best possible images, you want to ensure that your image file is in its native format. You can manually convert a file for RAW mode only, but Adobe's program Converter will do this automatically if it is on your computer or is on a computer on the web that you have access to. (I'm focusing on the earlier version of Photoshop in this chapter, so I'm assuming that your version of Photoshop is the one that allows for RAW conversion.) 3. **Create a copy of the image and open the copy in Photoshop** You need to have a copy of the file ready before you get started on making the HDR image, so create a copy of the file (as a duplicate of the file). The copy will be the one that you work on to produce the HDR image. The one you work on must be in the RAW file format and be open in Photoshop for it to be a viable HDR image. 4. **Open the file** Open the file and make sure that you are editing the copy of the file and that it is in the RAW mode (see the previous item). Now you're ready to create the Multichannel Image Merge, which is the fundamental process in creating a Single Channel HDR image. Now that you have your image in RAW format and have opened it in Photoshop, you

Elements/Aurora/Portrait On/Weathered On Opening a file for editing is called opening a file for design, opening a document for design, or opening a design. Most people just call it opening a document. To open a file for design, double-click it in the Photoshop Elements Files folder. To open a file in a separate window, use the icon of the rightmost file window. To open a specific file, press CTRL-L or CTRL-P. Press CTRL+D or CTRL+U to open a duplicate of a selected file. The symbols above the panel are: The difference between the file/page icons: To view the files or pages, press the Open File, page, or menu option. There are different viewing options. What to do about Nanking: 1915-1938. Before World War II, the plight of China was much on the minds of educated Britons. From the beginning of the war, many people advocated for the elimination of the racial hierarchies in China, which had been placed in place since the nineteenth century. In the Second Opium War, Britain was in the position of victor rather than defeated, and so had the power to bargain with China. One of the many ideas put forward by some Britons was the idea of "Nanking." This term would not survive the end of the war, but it was for many its popular meaning. Not everyone agreed with the construction of a modern civil government in China. Some wanted to keep the old order in place. But many others favored an extension of the rules of civilized behavior, as the British had in South Africa. One of the most famous advocates of the extension of the moral order to China was a young woman named May Young. Her views on China and Nanking are not as well known as they should be.Q: Using multiple sets of GPU's to accelerate deep learning I'm trying to understand the usage of GPU for deep learning. But, I couldn't find enough information on multi-GPU usage. All my searches are on single-GPU usage. Could you please help me? Thanks in advance. A: GPUs are used for deep learning in two different configurations. the first is, for differentiating between different computational tasks. For example the use of a convolutional Neural Network (CNN) for image classification and a recurrent Neural Network (RNN) for sequence classification. The implementation of these algorithms on the GPU is a lot different so you can see them as two different computation tasks. the second is, you can train models on your GPU with a batch size which is much smaller than you would be able to with a CPU. This article describes the use case of the GPU for ML applications. /* * To change this license header, choose License Headers in Project Properties. * To change this template file, choose Tools | Templates * and open the template in the editor. */ package com.loiane.cursojava.aula13; import java.util.ArrayList; import java.util.List; /** * * @author loiane */ public class ProximoNãoOb

Q: What's the best way to scale and compress responsive images? What is the best way to scale and compress responsive images without losing the original quality? A: I found this very interesting conversation on the topic. There is a short guide about it on my blog. You could have a look at it and have some further thoughts, but I am not sure what is the best compression level. Original answer from @DamienTheWebDev: I found a great post by my friend Marcin Szczepanowski. You could have a look at the beginnings of the landscape and the starting point of the discussion. The basic idea is: There is always a very high quality version of the image, and a low quality one for very small screens. How do you split the work between two different quality outputs? This is really hard. I recommend to set the quality threshold somewhere around 100% (for example, a low-quality image should have less than 10% of the original file size of the high-quality image). Then you have both resolutions for at least one quality, and it's easy to do the optimization on each one. Remember that any lossless compression algorithm can not compress a signal beyond 50%. There are other ways to optimize your images as well: HTML has introduced specific rules for optimizing images. That will decrease the file sizes. The usual URL and meta-tags have size restrictions. The HTTP protocol can be used to decrease the file size by several hundred bytes. and so on... You could read the post in more detail by Marcin. A: The best compression is the lossless one. But, you can compress images using lossy compression methods, as we know that it is bad practice. But it has its pros. It is easy to compress the images; it helps to preserve the color depth, which makes it easier to go in the future, for example, if you want to edit the color of the images. Please have a look at this post regarding the pros and cons of lossy compression. And see this post about the best type of compression. In this post I explain you how to compress an image using the Gzip algorithm. you will need a php library called gzip : in the composer you can find it. compress image here
