In 2015, the AutoCAD platform had more than 1.2 million active license users. Overview AutoCAD is used for 2D and 3D drafting, including drafting of blueprints, plumbing, and piping designs, structural design, landscaping design, home building design, schematic designs, and electrical, plumbing, and heating, ventilating and air conditioning (HVAC) design. It also has limited use as a DTM package. AutoCAD can generate 2D and 3D drawings, electronic plans, BIMs, bill of materials, and cost estimating, and is the primary platform for 3D printing and stereolithography (SLA) printing. Its 3D capabilities include triangular and quadrilateral mesh modeling and surface extraction. AutoCAD can output 2D drawings and engineering drawings directly to PDF, raster, and vector files. Other applications include non-CAD tools, such as fastener, gasket, and label applications, as well as image editing. AutoCAD provides an extensive set of functional tools that enable the creation of geometry and to produce excellent accuracy in all types of drafting situations. AutoCAD comes with several pre-defined template folders. You can create your own template folders to save time while working on a drawing or project. There are several templates for various 2D and 3D templates for various types of drawings. You can create your own template folder by starting to edit a template, then save the template folder. AutoCAD includes a rich set of intuitive tools that enable you to create high-quality 2D and 3D drawings and images. Pre-installed applications include the following: * A new layer is added automatically to all drawings. * Scales, grids, guides, grid snap, snap, and snap modes are available to help in navigating and drafting drawings. * The command line is used to enter and execute commands. * The Draw command dialog box and the Undo dialog box are used to view the most recent or an earlier version of a drawing. * The Calculate command can be used to calculate the properties of a drawing's elements. * The New/Modify command is used to create new or modify existing drawing objects. * The F-keys are used to navigate the drawing. * The menu system enables you to access tools and commands. * The Package Manager is

Add-ons are also available on Autodesk Exchange Apps. They include: Custom App: A number of standard, and some customized, applications are available for download, some available only for AutoCAD Cracked Version, others for AutoCAD LT and AutoCAD Architectural Desktop. Conceptual Apps: Conceptual apps are applications for drawings created by the user. The CAD concepts are limited to DWG and DXF only. The user can also create the concept in AutoCAD by using the Copy Commands tool, and then use a Conceptual App to either copy the concept to any drawing or use the concept in a Conceptual App. User App: The most useful and extended, or customized, applications for users available for download from Autodesk Exchange Apps. The spider Argiope bruennichi (Araneae, Araneidae) is widely distributed in Europe, South-East Asia, and Australia. This species was formerly classified as Argiope trifasciata, but after a redescription, Sørensen (1907) separated this species into three subspecies based on differences in chelicerae and palpal morphology. We here describe and discuss the life history of A. bruennichi, including stages of development, sex allocation, and sperm morphology. The total duration of the whole reproductive period (eggs to dead spiders) was about 31 days, which is similar to that of other orb-web spiders. The subspecies are further distinguished by a combination of life history and sperm morphology. Eggs were laid in groups of about 35-60, and the clutch size ranged from a minimum of one to a maximum of nine. Spermatozoa were observed during all stages of spermatogenesis, but spermatozoa were only found in the male reproductive system of mature adult females. We found various types of spermatozoa in different males of the same subspecies. However, in males of one subspecies, A. b. jentzeni, spermatozoa have only been found in the ejaculatory duct, but not in the ejaculatory bulb. In both subspecies, androgenic spermatozoa have been found. In some species of orb weavers, sex allocation is manipulated by nutrition; therefore, we hypothesized that differences in the dietary intake of different subspecies of A. bruennichi might be reflected in differences in sperm morphology. The eggs of females that were fed with common meat were rounder and had fewer yolks than those of females who were fed with sliced fish. However, in the two subspecies, no differences in the number of yolks or in the size of the eggs were observed. We conclude that differences in sperm morphology cannot be
