Open and operable for no reason, I have NO idea why MSI has done this but it is not a the time it should be installed. It's a major pain to get one to work. And if you figure it out, it could result in a critical system...so sorry, I don't think we should have to install this much nonsense. I have never had any problems with my computer and used it daily. But, I wanted to download the latest security update since the reason I bought it was to protect it. But, I don't know which of the updates to install. I know from what I've read that it can lock your system down, but I don't want to go through this nightmare process again. It can also spare you the trouble of buying newer hardware only to resolve an issue that can be otherwise fixed with firmware updates. There are two scanning options available: the automatic mode instructs the program to check all the items (drivers, BIOS, utility) and find available updates, while manual mode lets you choose the exact items you want to locate. Analyze scan results and run updates On scan completion, the results are displayed in a table where you can view the installed items and their version, access item information (including the release changelog), as well as start downloading items with a newer online version.
