Grammaire En Dialogues Niveau Debutante Pdf DownloadThe present disclosure relates to test systems, and, more particularly, to electrically conductive and electromagnetic test systems and methods. Known methods and systems for testing electromagnetic functionality and electromagnetic compatibility (EMC) may involve drilling test probes into a printed circuit board (PCB) and performing electromagnetic field (EMF) tests using the test probes. However, such methods and systems are limited to static EMC tests performed during a manufacturing process of a product and the obtained test results cannot be used for in-service testing. In addition, known methods and systems may involve utilizing expensive measuring equipment to test a product. Moreover, applying a known method to static testing limits the potential advantages of using the above-identified test probes. Intestinal changes induced by treatment with cis-platinum in the rat. The present study in the rat examines the effects of treatment with a single intraperitoneal (i.p.) dose of cis-platinum on the various components of the normal small bowel and colonic mucosa: intestinal epithelial cell turnover (assessed by the labeling index), functional activity (assessed by the absorption of the plasma protein lactulose), and histological integrity. Male Wistar rats were treated with a single i.p. dose of cis-platinum (16 mg/kg body weight). Animals were killed at different times (3, 12, 24, 48, and 72 hr) after treatment and the small bowel and colon were examined using a light and a scanning electron microscope. At the early times examined (3-12 hr) the results suggest (i) the existence of a selective effect of cis-platinum on the villus cells of the small bowel mucosa, in which the DNA synthetic activity is selectively affected in the absence of changes in the morphological integrity of the epithelial cells; (ii) an effect of cis-platinum on the mucosal surface of the small bowel, in which the DNA synthesis is not affected, but the scanning electron microscope studies show an important impairment of the surface structure. This effect is immediately followed by an effect on the morphological organization and cellular polarity of the intestinal lamina propria, with an increase in the number of secretory-type cells. (iii) A long-lasting effect on the lamina propria and Peyer's patches of the ileum, consisting of (1) an important loss of normal laminar architecture and cellular polarity
