Animals models of cognitive behavior have a long history in neuroscience and have now progressed to a degree where human behavior is viewed from a neuroscientific perspective. This chapter will focus on the behavioral measures that have been developed to assess the cognitive function of animals. The methods

include those that evaluate learning, memory, attention, motivation, stress response and exploratory behavior. Some of the procedures mentioned in this chapter have been extensively used in studies of long-term memory, working memory, associative learning, motivation and neurodegenerative diseases in which cognitive impairment is a feature of the disease. Behavioral paradigms that are more limited in their application in some of the cognitive areas described will also be addressed.Q: Why does std::insert() with a move-initializer not crash?
